1. **Install BIND and bind utils**
2. **ADD 2 different zone and test it to resolve any hostname**
3. **Configure Master and Slave**

   3.1 Make first zone master on one host and second on different host

4. **Configure Reverse zone and test it**

   dig   -x "IP address"   should return the domain name

5. **Map one domain name to another**
6. **After each change in the master zone file, the entries must be copied to the slave dns**
